

TREAT WITH TURBO SEED ZN

WHEAT

MAIZE

BEANS

TURBO SEED ZN

Powered by Humifirst

Contains Phosphorus (27 %), Potassium (16 %) and chelates of Copper (2.2 %), Zinc (2.2 %) & Manganese (0.6 %) in a concentrated powder form. Micronised humics make Turbo seed Zn ideal for seed dressing, ensuring vigorous germination and early seedling robustness.

A must for every farmer each time they are planting

Available in 10g, 500g & 20kg packs

PLANTING TODAY? USE Turbo Seed Zn

What is Turbo Seed- a 100% water soluble powder fertilizer used to provide P,K,Cu,Zn,Mn & Humic acid to seeds, seedlings and transplant materials

How much is needed-

- Wheat, millet, sorghum, rice, grasses, pepper, etc. (small grains) use 2.5g/Kg - 5g/Kg seed.
- Maize, beans, groundnuts, etc. use 5g/Kg seed.
- Tubers (Potatoes), vines & Cuttings (sugarcane, cassava, etc)- Dip in a mild solution of 10g of Turbo Seed Zn in 1Lt of water for every Kg of planting material, or spray & cover for two days

How is it applied

- Seed dressings as a spray-dissolve 5g or 2.5 gm in 20ml of water and spray accordingly. e.g. 5gm/Kg of maize or 2.5 - 5gm/Kg of wheat. Then spread your seeds under shade to dry/before bagging.
- Seed dressing as a dry powder. Wet & Dust/Wet seed slightly with plain water using hand sprayed then dust with appropriate amount of Turbo Seed Zn. The wetting helps the powder stick.
- Applied in planting water: Drill seeds directly on nursery bed, make a 50g/Lt of water solution of Turbo Seed Zn and drench 1m² of soil; appropriate for small seeds like tomato, pepper, kales, etc.
- For cuttings, tubers and vines; make a 50g/Lt of water solution, spray or drench the planting material and plant.

When is it applied:- As close to planting as possible. Turbo Seed Zn can be applied early and dry/grain stored for up to 30 days.

Why is it applied

- An annual plant's potential yield is determined within the first 7 days of germination. A good start is imperative. Turbo seed Zn:
- Supplies critical nutrients directly to the planting material in an available and non toxic form
- Enables faster /better germination (early root & shoot formation)
- Helps get a higher germination percentage (better seed economy)
- Leads to early crop vigor that enables the crop to compete strongly with emerging weeds
- In a program with new technologies can cut the cost and application volumes of bulk/inorganic fertilizer applications

Turbo Seed Zn can be applied with other insecticide or fungicide seed dressings. Excellent results obtained with Eco-T (fungicide) and Vlazyme

Lachlan (K) Ltd is providing a free seeds treatment service incorporating a full regime of pre-planting products, AT THE FARM GATE.
